

4INSECTS

PROFESSIONAL MONITORING AND PEST CONTROL

ENG

4NSECTS

is a HI-PRO-CHEM brand

HI-PRO-CHEM is an industrial brand that specialises in the design, production and sale of technologically advanced products for the management of pests that may otherwise contaminate the food production chain.

Founded in 2008 with a view toward developing a technical/commercial synergy with O.S.D. Gruppo Ecotech, a company specialised in the development of specific equipment for the professional pest management sector, HPC immediately stood out for its strong innovative character.

4INSECTS is a new production line attentive to the environment, which ranges from glue traps to essential oil extracts, pheromones to beneficial insects.

HPRFLY005 is a specific glue trap with integrated attractant tablet for the monitoring and capture of cockroaches. Its special formation makes it ideal for all types of use in both the professional and civil sector.

The plasticised cardboard offers the trap resilience even in damp environments, otherwise ideal for the spread of cockroaches.

The large surfaces allows a large number of captures, each conveyed to the glue by the liquorice scented attractant tablet.

Mod. HPRFLY005

4NSECTS

The HPR9220 monitoring and capture station is the result of in-depth studies and research on the optimisation of management costs.

The station made in Easy Check plastic is equipped with a special housing for the glue board and a specific space for attractants or pheromones carved into the lid and closed by a plug.

The half-moon-shaped trap means it can be positioned either against the wall or in corners, making it particularly suited to very damp areas.

Mod. HPR9220

4INSECTS

MONITOR TRAP is a specific trap for the monitoring and capture of flying insects. Featuring a large surface covered with glue on all three inner sides, it enables a very high rate of capture.

Easy to assemble and hang, it can be equipped with specific pheromones to improve its performance.

The personalised graphics help the professional operator more easily identify and archive recorded captures.

Mod. HPR1103

4INSECTS

The pagoda trap in the 4insects series has been developed to facilitate professional operators during its assembly.

The inner surface is completely covered in glue and can be activated by simply opening the trap. The latter will automatically define its own shape without the need for any folding or other action on the flaps of the trap.

The large surface allows a high rate of capture, enhanced by the integration of specific pheromones or attractants. The sturdy plasticised cardboard and special shape make it perfect for positioning even in damp or dusty locations.

Mod. HPR1106

4INSECTS

HPR1035 is a specific KIT for the capture of brown marmorated stink bugs.

Designed to be high-performing, it is equipped with a double-sided, large adhesive surface and a specific pheromone for *Halyomorpha Halys* inside a tamper-proof dispenser.

The pheromone structured as such can be reused on other boards, thus optimising management costs.

4NSECTS

The growing need for pest control in stock materials led the research group to develop a specific roll with an adhesive surface designed to be positioned around the perimeter of pallets.

HPRFLY008 is useful in trapping all crawling insects able to infest materials stored on the floor or on shelves and pallets.

The large adhesive surface guarantees excellent coverage and protection and is ideal for warehouses and logistics centres.

Mod. HPRFLY008

4 INSECTS

4INSECTS completes its range of glue traps with a series of glue boards suitable for use in the majority of professional UV lamps currently available on the market.

Colours, graphics, customisations and packaging are some of the many added values of the 4INSECTS range.

4INSECTS boards are made using very high quality materials and glue, resistant to UV rays.

GLUE BOARDS

4INSECTS integrates its production of glue traps with a range of very high quality pheromones from the RUSSELL IPM range, the world's largest producer of pheromones and attractants for insects.

The pheromones are developed on special slow-release supports, perfect for the monitoring and capture of the insects that most commonly infest foodstuffs.

The 4 SEASON range, coloured according to the current season, makes it easy to manage a perfect replacement routine.

Products in the RUSSELL IPM range are distributed exclusively by HI-PRO-CHEM.

PHEROMONES

INTEGRATED PEST MANAGEMENT

4 INSECTS

4INSECTS integrates traps and pheromones with a new range of products for the scenting of outdoor environments, formulating new emulsions with essential oils derived from natural raw materials.

The range of concentrated natural air fresheners can be used professionally with special automatic nebulizer diffusers or manual spraying systems.
